

ABSTRACT OF THE DISCLOSURE

A container suspending device is capable of being processed as waste without causing any problems while maintaining advantages of a conventional container suspending device, wherein a plurality of circular openings are provided in a paper container suspending base plate, a plurality of lock pieces extending inwardly are formed from inner peripheral edges of the circular openings, diameters of the circular openings are formed so that head parts of containers to be suspended can pass therethrough and diameters of virtual circles formed by connecting tips of the plurality of lock pieces to each other are formed smaller than diameters of lock parts formed on peripheries around the head parts of the containers.
